#### **Abstract**

### 1 Introduction

The aim of this work is to develop a web based information system that enables assignment planning for lecturers in our school at the Department of Technology and Computer Science. The challenge we face is to create effective planning by involving the teachers themselves in this process. We decided to make a web application that will meet all the requirements and will be created using suitable modern technologies. Technologies such as ASP.NET Core Blazor Server with Entity Framework Core (EFCore) and MS SQL (Microsoft Structured Query Language) for the database were chosen. ASP.NET Core Blazor is a new framework that is gaining popularity. Interestingly, thanks to it, it becomes possible to do the entire application in C# without using JavaScript.

In project 2, we created a prototype. In this work, the system will be detailed and expanded. In particular, the following goals are pursued:

- Involvement of teachers in the planning process. Teachers are able to create and manage their own medium- and long-term deployment plans.
- Grouping of lecturers. It should be possible to schedule several lecturers for the same module.
  - Teachers who join a group can independently manage their assignments related to their common module.
  - Each teacher can make a group with another lecturers.
- Grouping of the modules. The group of lecturers can choose the group of modules and set themselves to it. This can be done in the form of a proposal for the definitive plan, which is then approved by the person responsible for the planning.

#### 1.1 Acronyms

Acronyms	Words
EF	Entity Framework
CSS	Cascading Style Sheet

## 1.2 Glossary

- FURPS+eeles2005capturing is a system for classifying requirements.
  - Functionality
  - Usability
  - Reliability
  - Performance
  - Supportability
- **SignalIR** is a free and open-source software library for Microsoft ASP.NET that allows server code to send asynchronous notifications to client-side web applications.
- Blazor is a free and open-source web framework that enables developers to create web apps using C# and HTML. It is being developed by Microsoft.
- EF Core
- HTML HyperText Markup language
- SQL Structured Query Language
- JS JavaScript
- CRUD Create, read, update and delete
- UI User Interface
- API Application Programming Interface
- MS Microsoft
- BPMN Business Process Model and Notation

# 2 Project Management

#### 2.1 Effort Estimation

The Bachelor's Thesis is designed as a 12 ECTS module. This corresponds to a workload of 360 hours. When we are working on a project, we always record our hours of work in an Excel table. At the end of the project, we will compare this time with the time allotted for the project.

#### 2.2 Scrum

The foundation of the project organization was Scrum. Some principles of Scrum could not be achieved since they need a group of more than two people. Our work was based on the principles of Scrum like the Empirical Process of Control, the core of Scrum, self-organization, value-based prioritization, etc. The Empirical Process of Control includes three main ideas, namely transparency, inspection, and adaptation.

Transparency: The work is carried out in full trust of all parties involved. Everyone has the courage to keep each other up to date with both good and bad news.

Inspection: Inspection is carried out by every one in the Scrum Team. The team openly shows the product at the end of each Sprint.

Adaptation: The team asks constant questions about the progress of work, whether we are on the right way. Depending on this, we can adapt an existing product.

At the beginning of the project, we have discussed and estimated all the work that needs to be done. Meetings between supervisor and developer are weekly and sometimes bi-weekly. Each meeting includes a discussion about what has been achieved since the tasks have been assigned, what can be improved, and scheduling of future tasks.

#### Scrum Roles

• Product Owner: Mr. Pfahrer

• Development Team: Shiryagina Kristina

• Scrum Master: Shiryagina Kristina

#### Scrum Plan

To discuss the project, were weekly and biweekly meetings held . They included personal meetings or meetings using Microsoft Teams. The meetings consisted of:

- Sprint Review. It includes a show of work and its discussion.
- Sprint Planning. It includes the scheduling of future tasks.
- Sprint Retrospective. It includes discussion about what went well and what went wrong, what we should do differently.

# 3.2 Functional Requirements

# 4 System Architecture and System Design

In project 2 we have started with describing of System architecture and design. In this work we want go deeper into this topic.

# 5 Domain Analysis

# 6 Technologies

# 7 Creating the Projects

- 7.1 Structure of Projects and Folders
- 7.2 Data Models
- 7.3 Entity Framework Core Packages
- 7.4 Connection String
- 7.5 Creating the Database Context Class
- 7.6 Entity Framework Core Configuration

#### 7.7 Database and Entity Framework Core

Entity Framework(EF) Core is an object-relational mapper (O /RM). It is designed to make writing code for accessing a database quick and intuitive. There are many good reasons to use EF Core. It supports LINQ queries, change tracking, updates, and schema migrations. EF Core works with many databases, including SQL Database, SQLite, MySQL, PostgreSQL, and Azure Cosmos DB. book efa ef

#### 7.8 The PLANA App's Relational Database

Our database has many types of relationships we can have in EF Core. The types are: One-to-many: Lecturer Many-to-many: One-To-Many Relationship: Lecturer to an Additional Assignment Semester to a Module Run Module to a Module Run Study Branch to a Module Many-To-Many Relationship: Lecturers to Semester Lecturers to Module Lecturers to Module Run

#### 7.9 Modeling Types of Database Relationships

#### Many-to-many Relationship

Creating many-to-many relationship is little bit different from the one-to-many and one-to-one. We will take as example relation between Lecturer and Module.

In EF Core database doesn't directly implement this kind of relationships. First we have to create class Lecturer and class Module. Then we have to create one more class, we call it LecturersModules. This class links lecturers to their modules.

At the LecturerModules class there are two properties, LecturerId and ModuleId. There are both - primary keys and foreign keys, known as a composite key.efa

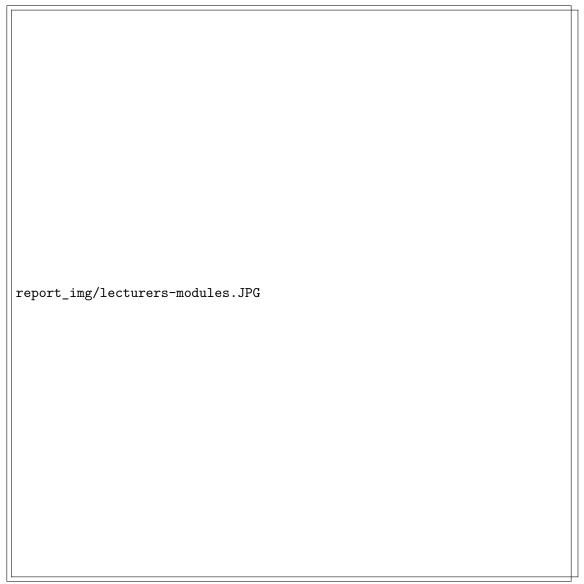

Figure 1: The LecturersModules entity class

The next step is adding necessary code to the AppDbContext class. We add

- DbSet<Lecturer>
- DbSet<Module>
- DbSet < Lecturers Modules >

The Figure 2 below shows this process. In the OnModelCreating method we add

• modelBuilder.Entity<LectuerersModules>().HasKey(x=> new x.LecturerId, x.ModuleId;

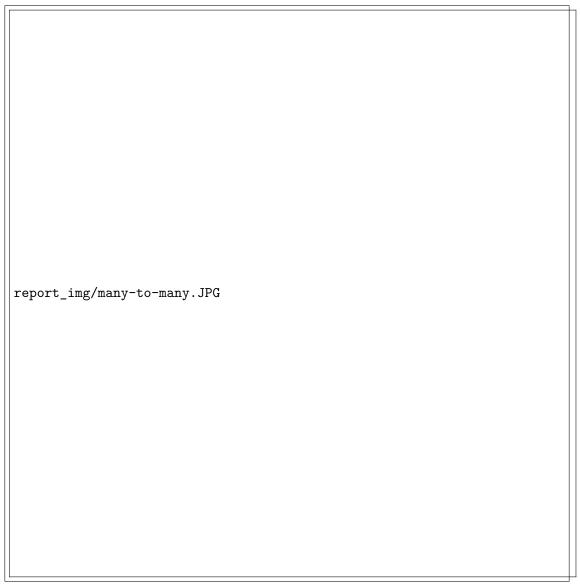

Figure 2: Adding Entity LecturersModules to the AppDbContext class

We need write just this and Entity Framework Core will do the correct implementation that we can see then in the migration files.  ${f patrick}$ 

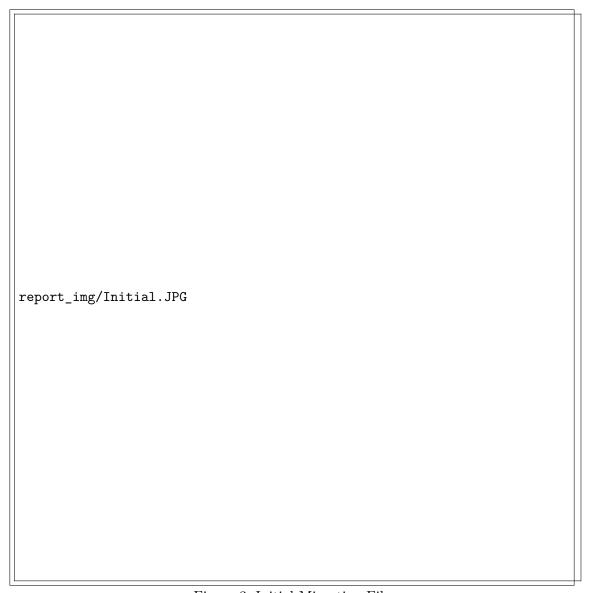

Figure 3: Initial Migration File

From Figure 3 we can see that one many-to-many relationship has transformed in two one-to-many and many-to-one relationships.

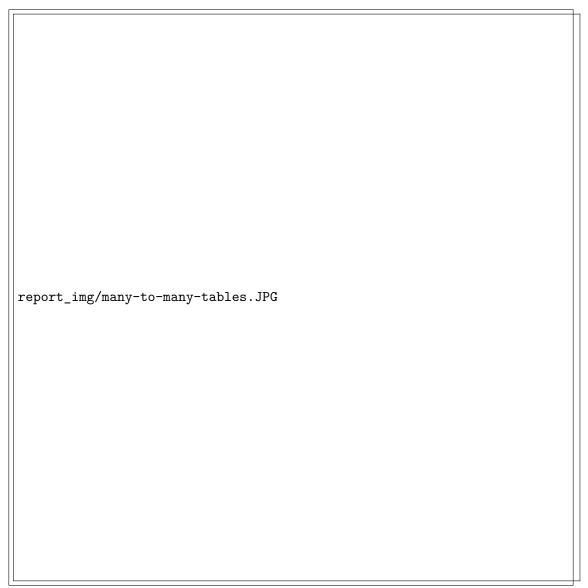

Figure 4: Creating Many-To-Many Relationship

# 7.10 Creating Database

## 7.11 Creating a Repository

todo: photo of repository

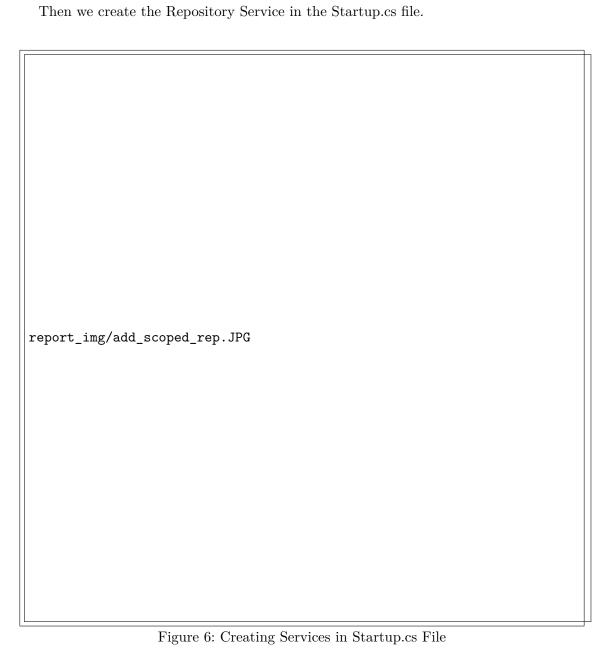

In our project we create a repository interfaces and implementation classes.

We use **IQueryable**<**T>** and **IEnumarable**<**T>** interfaces. With IQueryable<T> interface the objects can be queried in more efficient way.

For example: public IQueryable<ModuleRun> ModuleRuns => appDbContext.ModuleRuns; the ModuleRuns property in the context class returns a DbSet<ModuleRun> object, which implements the IQueryable<T> interface.

report\_img/repo-create.JPG

Figure 5: The ModuleRunRepository.cs file in the Plana.Api/Models folder

core3

## Creating the Database Migration, Code-First Migration

Entity Framework Core makes it possible to generate schema for the database from the data model classes using **migrations dotnet em migrations add Initial core3** 

#### 7.12 Creating Seed Data

The seed data is the data that is used to populate the database. For seed data we add class SeedData.cs in the Models folder in Plana.Api project **core3**. By default, Entity Framework Core uses cascade deletes for depend relationships with non-nullable foreign keys. **efa** 

..add photo of seed class (give it name The contents of the SeedData.cs class

#### Configuration of Core Services and Entity Framework

It is necessary to make changes in Startup.cs class in Plana.Api project - configure Entity Framework Core and set up the services that will be used to access the database **efa**. The figure below shows all these configurations.

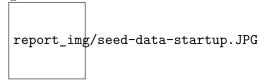

Figure 7: Startup.cs in the Plana. Api project. Preparing Services and Middleware

#### 7.13 Create an Controller

#### **Complex Data Model**

in this section I would like to highlight more complex features of coding and data model structure in asp .net core.

Figure 8: LecturerRepository.cs file in the Plana.Api project's folder

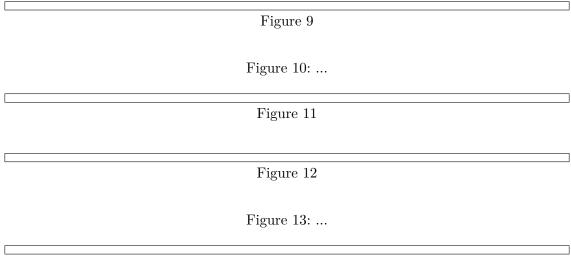

Figure 14

#### **Blazor Server**

## Configuring ASP.NET Core for Blazor Server

#### Call the API from Asp.net Core Blazor

- .. add picture with a blazor page
- ...write about imports
- ... write about registration of http client services
- Figure 15: Registration of Http Client Services in Startup File in Plana. Web Project folder
- Figure 16: Adding Services and Middleware in the Startup.cs File in the Plana. Web project folder

When we need to use some data from other folders in a blazor files like Razor files(.razor) all necessary imports we include in the partial class \_\_Imports.razor using the @using directives.

Figure 17: Adding required namespaces to the \_Imports.razor file in Plana.Web project folder

#### 7.14 Setup for Blazor

To use the Blazor framework it is necessary to install:

- .NET Core SDK 3.1 or later from http://dotnet.microsoft.com/download
- Visual Studio 2019 from https://visualstudio.microsoft.com/downloads/

The sprints covered a one three-four weeks period. At the end of each sprint, there was a discussion with the supervisor.
